FOREWORD

This publication on Crops Statistics of the Philippines is the fourth edition of this statistical report. It presents annual statistics on production, area planted/harvested, and number of bearing trees/hills of 48 crops, with national and regional levels of disaggregation. A brief description and analysis of the trends of the statistics from 2017 to 2021 are also included.

The crops covered in this publication are classified into four commodity groupings, namely, Cereals, Fruit Crops, Non-Food and Industrial Crops, and Vegetables and Root Crops. In the case of banana, mango, coffee, and tobacco, statistics are further disaggregated by major variety.

This report was prepared by the Crops Statistics Division (CSD) of the Philippine Statistics Authority (PSA) as a ready reference for various stakeholders in the crops subsector of agriculture. Comments and suggestions from the readers are welcome for further improvement of this publication.

BACKGROUND

Scope and Coverage

Crops statistics are generated for all regions, except the National Capital Region. The Palay Production Survey (PPS) and Corn Production Survey (CPS) are the sources of data for palay and corn, respectively, while data for all crops other than palay and corn are sourced from the Crops Production Survey (CrPS). Around 280 crops are covered by these surveys. For this publication, information on 48 crops is reported. These crops are as follows:

Commodity Grouping	Major Crops	Other Crops
Cereals	Palay and corn	-
Fruit Crops	Banana, calamansi, mango, and pineapple	Durian, lanzones, mandarin, mangosteen, orange, papaya, rambutan, tamarind, and watermelon
Non-Food and Industrial Crops	Abaca, cacao, coconut, coffee, rubber, sugarcane, and tobacco	Cashew and oil palm
Vegetables and Root Crops	Ampalaya fruit, cabbage, cassava, eggplant, mung bean/mongo, onion, potato, sweet potato/camote, and tomato	Asparagus, broccoli, carrots, cauliflower, garlic, ginger, bottle gourd, snap beans/habitchuelas, lettuce, lady's finger/okra, peanut, Chinese pechay, native pechay, taro/gabi, and greater yam/ubi

Sampling Methodology

Starting 2021, the sampling designs of the PPS and CPS use the results of the 2012 Census of Agriculture and Fisheries (CAF) and 2017 Listing of Farm Households (LFH) as the sampling frames. The PPS and CPS employ a two-stage sampling scheme with province as domain. The barangay is the primary sampling unit, which is selected using probability proportional to size. The farming household serves as the secondary sampling unit, which is selected using ordered systematic sampling.

For the CrPS, the top five producing cities/municipalities of a certain crop are chosen as sample cities/municipalities for each province. Then, from each of these cities/municipalities, five sample farmer-producers are selected as respondents. In this two-stage design, city/municipality serves as the primary sampling unit, while farmer-producer is the secondary sampling unit.

Data Collection

For PPS and CPS, data collection is conducted quarterly during the first 10 days of the month after the reference quarter, except for the fourth quarter where data collection is made earlier. For CrPS, data collection is also conducted quarterly during the last 10 days of the middle month of the quarter. Both surveys gather data on production and area planted/harvested. For CrPS, data on the number of bearing trees/hills are also gathered.

Data Review and Validation

Data review and validation are conducted quarterly to ascertain the accuracy of the data produced from the surveys. The data review and validation process start at the Provincial Statistical Offices (PSO) after the data processing. All provincial estimates undergo further data review and validations at the regional level, which is conducted by personnel at the Regional Statistical Services Offices (RSSO).

All validated provincial and regional estimates are submitted to the CSD for final review. Consultations and discussions between representatives from the RSSOs and personnel from the CSD are held during the National Data Review before officially releasing the statistics.

Concepts and Definitions

The following concepts and definitions are used in the generation of statistics for crops:

Area harvested refers to actual area from which harvests are realized expressed in hectares. This excludes crop areas which were totally damaged. It may be smaller than the area planted. In crops statistics, this applies to mono-harvest temporary crops.

Area planted refers to actual physical area planted. This generally applies to area reported for permanent crops and multi-harvest temporary crops.

Bearing trees/hills/vines refer to number of trees/hills/vines where harvesting has been made in the past and may or may not have borne productive fruits during the reference period due to cyclical production pattern of the crop. Hills applies to banana. Vines applies to grapes and the like.

Crop production refers to the quantity produced and actually harvested for a particular crop during the reference period. It includes those harvested but damaged, stolen, given away, consumed, given as harvester's share, reserved, etc. It excludes those produced but not harvested due to low price, lack of demand, force majeure, or fortuitous events, etc.

Effective area harvested refers to the actual area which is counted as many times as it was planted and harvested to same crops during the reference period. This concept applies to the harvest area reported for mono-harvest temporary crops such as rice, corn, root crops, tubers, and pechay.

High yielding variety (HYV) refers to an improved cultivated variety with significantly higher yield and better quality under specific environment and improved farming conditions and practices than the traditional seed varieties being used; any agricultural crop variety that can equal or exceed the yield of the current commercially grown variety in a particular locality. HYV may be locally or foreign bred.

Industrial crops are crops that are used as inputs to other industries. *Examples are rubber, castor beans, abaca, and oil palm.*

Irrigated palay refers to palay crop which receives irrigation water during its development. Irrigation may be available through artificial means like gravity, force/power, pump, etc. Irrigated area become rainfed only when the irrigation system is no longer operational for the past two years and beyond repair and there is no plan of irrigating the farm.

Major crops are the 22 crops, which collectively account for almost 95 percent of the total crop production. These include palay, corn, coconut, sugarcane, banana, pineapple, coffee, mango, tobacco, abaca, potato, mongo, cassava, sweet potato, onion, tomato, ampalaya fruit, cabbage, eggplant, calamansi, rubber, and cacao.

Minor crops refer to all the remaining crops other than the major crops. This group accounts for the remaining 5 percent of the total crop production.

Non-food crops are crops other than those used for food consumption. These are crops grown for their aesthetic values such as ornamental plants and cut flowers. These also include agriculture-derived products such as rice hay and coconut leaves.

Permanent/Perennial crops are crops which occupy the land for a long period of time and do not need to be replaced after each harvest such as fruit trees, shrubs, and nuts. These crops may be productive or fruit-bearing crops. *Examples are avocado, coffee, coconut, and other fruit trees.*

Rainfed palay refers to area holds standing water but solely dependent on rainfall for its water supply.

Root crops are crops with well-developed underground edible roots. They are classified into roots and tubers. Roots which are starchier and richer in carbohydrates include gabi, ube, and white potato. Tubers include beets, radish, carrot, and turnips.

Temporary crops are crops which are grown seasonally and with a growing cycle of less than one year and which must be sown and planted again for production after each harvest. Some of these crops grow beyond one year but are eventually uprooted to start another production cycle, e. g., peanut, mongo, cassava, tomato, garlic, onion, cabbage, and eggplant.

Vegetable crops are mostly temporary crops which are either classified agronomically as such or based on purpose for which they are used, like jackfruit which on their young stage is classified as vegetable.

White corn refers to corn grown and used mainly for human consumption and manufacture of corn by-products such as cornstarch, corn oil, syrup, dextrin, glucose, and gluten.

Yellow corn refers to corn used generally as feed grains. It includes all types of corn other than white.

Yield refers to the average production per unit area. It is an indicator of productivity derived by dividing total production by the area harvested or number of bearing trees/hills/vines.

PALAY

The estimated total palay production of the country for the period 2017 to 2021 increased by an average annual rate of 0.9 percent. From 19.28 million metric tons in 2017, it grew to 19.96 million metric tons in 2021. Meanwhile, the estimated total area harvested decreased from 4.812 million hectares in 2017 to 4.805 million hectares in 2021. During this period, the peak of production and area harvested were recorded in 2021 at 19.96 million metric tons and in 2017 at 4.812 million hectares, respectively. (Figure 1, and Tables 1.1 and 1.2)

In 2021, the country's palay production reached a total of 19.96 million metric tons. This was 3.4 percent higher than the previous year's output of 19.29 million metric tons. More than three-fourths (75.6%) of the total palay output were from irrigated areas, while the remaining 24.4 percent were from rainfed areas. (Figure 2 and Table 1.1)

Central Luzon remained to be the top producer of palay with 3.74 million metric tons output, equivalent to 18.7 percent of the country's total palay output in 2021. The other top producing regions were Cagayan Valley with 14.6 percent share and Western Visayas with 11.8 percent share. (Figure 3 and Table 2.1)
